HTML & CSS Mini Website Collection

A collection of beginner-friendly websites created using **HTML5** and **CSS3**. The uploaded source files contain three separate website pages: a food ordering website, a tourist destination page about the Taj Mahal, and a restaurant menu page.

Project scope: *These are standalone HTML pages, not one connected multi-page application. The Foodie page links to* `abcd.css`*; the other two pages contain their CSS inside their HTML files.*

1. Project Title

HTML & CSS Mini Website Collection

Main page: **Foodie – Food Ordering Website**

2. Project Description

This project demonstrates basic front-end web design using HTML and CSS. It includes a Foodie page that presents a restaurant, food categories, menu items, prices, a special offer, and customer reviews. It also includes two additional standalone examples: a Taj Mahal tourist information page and a restaurant menu page.

The pages use headings, paragraphs, lists, images, navigation links, sections, and CSS styling to organize information and improve presentation.

3. Project Objectives

- Practice creating web pages with HTML.
- Apply CSS to style page backgrounds, text, spacing, borders, and images.
- Organize content using headings, sections, lists, and containers.
- Present food menus and tourist information in a readable format.
- Learn basic responsive styling through the viewport setting and a CSS media query in the Foodie page's stylesheet.

4. Features

Foodie – Food Ordering Website (`abcd.html`)

- Header with the Foodie name and navigation links.
- Home section with restaurant name and delivery information.
- Menu section with pizza, burger, and biryani items.
- Displays item descriptions and prices.
- “Order Now” links that navigate to the offers section.
- Special offer information: 20% off the first order.
- Customer review examples.
- Footer with a copyright notice.

- Uses an external stylesheet named `abcd.css`.

Taj Mahal – Tourist Destination (`akka.html`)

- Displays a Taj Mahal heading and image.
- Provides a short description of the destination.
- Lists places to visit, things to do, and food to try.
- Uses embedded CSS for page styling.

My Restaurant (`rohitha.html`)

- Displays a restaurant welcome message.
- Organizes food into starters, main course, and desserts.
- Uses unordered and ordered lists.
- Includes a food image element.
- Uses embedded CSS for styling.

Styling (`abcd.css`)

- Page background, typography, text alignment, and colors.
- Card styling with borders, rounded corners, and shadow.
- Image sizing and `object-fit`.
- A media query for screens up to 480 pixels wide.

5. Technologies Used

Technology	Use in the uploaded files
HTML5	Page structure, headings, paragraphs, links, lists, sections, and images
CSS3	Colors, fonts, spacing, borders, layout styling, and a media query

No JavaScript, backend framework, database, or payment integration is present in the supplied source files.

6. Project Architecture

The supplied files form three separate HTML pages:

```
Browser
  |
  +-- abcd.html (Foodie page)
  |       |
  |       +-- abcd.css (external stylesheet)
  |
  +-- akka.html (Taj Mahal page)
  |       |
  |       +-- CSS embedded in the HTML file
  |
  +-- rohitha.html (My Restaurant page)
          |
          +-- CSS embedded in the HTML file
```

The browser reads each HTML file and applies its CSS. The Foodie page references an external stylesheet. The other two pages include their styling in `<style>` elements.

7. Project Folder Structure

The following is a suggested folder arrangement based on the uploaded files. The image files shown are referenced by the HTML but were **not included** in the uploaded set.

```
html-css-mini-websites/
|-- abcd.html
|-- abcd.css
|-- akka.html
|-- rohitha.html
|-- 1.jpg          # Required by akka.html; not supplied
`-- naveen.jpg     # Required by rohitha.html; not supplied
```

The Foodie page also loads some food pictures from external image URLs, so those images require an internet connection.

8. Installation Steps

No package installation or build process is required for the supplied HTML and CSS files.

1. Download or copy the project files into one folder.
2. Keep `abcd.html` and `abcd.css` in the same folder so the stylesheet link works.
3. Add the missing local image files (`1.jpg` and `naveen.jpg`) to the project folder, or update the image paths to match the files you have.
4. Open the folder in a code editor such as Visual Studio Code, if available.

9. How to Run the Project

1. Open the project folder.
2. Double-click the HTML page you want to view, or open it through a web browser.
3. To view the main Foodie page, open `abcd.html`.
4. To view the Taj Mahal page, open `akka.html`.
5. To view the restaurant menu page, open `rohitha.html`.

Optional: If Python is installed, run a local static server from the project folder:

```
python -m http.server 8000
```

Then visit `http://localhost:8000/` in your browser and select an HTML file. Stop the server with `Ctrl+C`.

10. Input and Output Details

Input

- The user opens one of the supplied HTML files in a browser.
- The pages use content written directly in HTML.
- The pages reference image files or external image URLs.

There are no user input forms or data-processing inputs in the supplied code.

Output

- `abcd.html`: Foodie home, menu, offer, reviews, and footer.
- `akka.html`: Taj Mahal information, places to visit, activities, and food suggestions.
- `rohitha.html`: Restaurant introduction and categorized food menu.

11. Screenshots / Output Images

No browser screenshots were included in the uploaded files.

To add screenshots to this README:

1. Open each HTML page in a browser.
2. Capture a screenshot of the displayed page.
3. Create a folder named `screenshots`.
4. Save the screenshots in that folder and add Markdown image references, for example:

```
![Foodie website](screenshots/foodie.png)
![Taj Mahal page](screenshots/taj-mahal.png)
![Restaurant page](screenshots/restaurant.png)
```

The image references above are examples only; the screenshot files have not been supplied.

12. Future Enhancements

The following are possible future improvements and are not currently implemented:

- Add a working order form and order submission flow.
- Add JavaScript for interactive features and input validation.
- Add a backend and database if order and customer data need to be stored.
- Add a responsive navigation menu and test the pages on different screen sizes.
- Add the missing local images and provide meaningful alternative text for every image.
- Improve navigation and visual consistency across the three standalone pages.

13. Conclusion

This collection demonstrates the use of HTML and CSS to create and style simple web pages. The Foodie page presents restaurant and menu information, while the other pages demonstrate how tourist information and restaurant menus can be organized. The project provides a foundation for further front-end development.

14. Author Details

- **Author name:** Not provided in the uploaded files.
- **Course / Department:** Not provided.

- **College:** Not provided.
- **GitHub profile:** Not provided.

Update this section with the correct details before publishing the repository.

Note: The uploaded source includes three separate HTML pages. Only `abcd.html` is explicitly titled “Food Ordering Website” and uses `abcd.css`. The files do not establish that the three pages are connected as one application.
